

HOW TO USE AtomJPEG LIBRARY

1. Import Java Package

- `import com.atom.utils package`
(Do not change package name - for JNI library)

2. Import AtomJPEG library

- `import libatomjpeg.so`
- LIKE `src/main/WEB-INF/lib/`
- Then you add build path or setup pom.xml

3. Recompress images by AtomJPEG (example)

- `AtomOptions ao = new AtomOptions();`
`ao.profile = AtomUtils.PROFILE_MAIN;`
`ao.level = AtomUtils.NORMAL_QUALITY;`
`ao.keepFileFormat = 1; // it must be 1`
`ao.width = 0;`
`ao.height = 0;`
(If you specify the width and height to zero is converted to the same size as the original resolution.)

`long resultSize = AtomUtils.`

- Atom Profile options
 - `AtomUtils.HIGH_QUALITY`
 - `AtomUtils.NORMAL_QUALITY`
 - `AtomUtils.HIGH_COMPRESSION`
 - `AtomUtils.EXTREME_COMPRESSION`
- Atom Level options
 - `AtomUtils.PROFILE_FAST`
 - `AtomUtils.PROFILE_BASELINE`
 - `AtomUtils.PROFILE_MAIN`
 - `AtomUtils.PROFILE_HIGH`
- When you receive an image crawl request, empty the temporary folder.
- Please create a temporary directory of crawled images and save them in there.
 - example) if temporary directory name is temp
 - `temp/org/crawled_001.jpg`
 - `temp/org/crawled_002.jpg`
 - `temp/org/crawled_003.jpg`
 - and so on...
- Then recompressed images are save into atom directory
 - ex) `temp/atom/crawled_001_atom.jpg`

- temp/atom/crawled_002_atom.jpg
- and so on...
- If you press the download button, please compress all temp/org, temp/atom images into one zip file and download the zip file. (please refer to page 3 of PPT)
